

## Stat 134: Section 17

Adam Lucas

April 8th, 2019

### Conceptual Review

- Let  $X, Y$  have joint density  $f_{X,Y}$ . Draw a picture showing what we mean by  $P(X \in dx, Y \in dy)$ .
- If  $X, Y$  are jointly uniformly distributed over a region, what does their joint density look like?
- $X, Y$  are jointly distributed on the region  $(x, y) : 1 < x < y < 3$ . True or false:  $X, Y$  could be independent.

### Problem 1

A metal rod is  $\ell$  inches long. Measurements made using this rod are distributed uniformly from  $\ell - 0.1$  to  $\ell + 0.1$  inches, accounting for random error. Assume measurements are independent of each other.

- Find the chance that a measurement is within 0.01 inches of  $\ell$ .
- Find the chance that two measurements are within 0.01 inches of each other.

Draw a picture to help visualize this event.

Ex 5.1.2 in Pitman's Probability

*Problem 2*

Suppose that  $(X, Y)$  is uniformly distributed over the region  $\{(x, y) : 0 < |y| < x < 1\}$ . Find:

- The joint density of  $(X, Y)$
- The marginal densities  $f_X(x)$  and  $f_Y(y)$
- Are  $X$  and  $Y$  independent?
- Find  $\mathbb{E}(X)$  and  $\mathbb{E}(Y)$ .

As before, draw a picture of the region. This will help you to set bounds for integration, and may provide a hint for part (d).

*Ex 5.2.1 in Pitman's Probability*

*Problem 3*

**Minimum and maximum of two independent exponentials.** Suppose  $S$  and  $T$  are i.i.d. Exponential ( $\lambda$ ) random variables. Define  $X = \min\{S, T\}$ ,  $Y = \max\{S, T\}$ , and  $Z = Y - X$ .

- Find the joint density of  $X$  and  $Y$ . Are  $X, Y$  independent?
- Find the joint density of  $X$  and  $Z$ . Are  $X, Z$  independent?
- Identify the marginal distributions of  $X$  and  $Z$ .

Consider  $P(X \in dx, Y \in dy)$ . What are the possible ways this could happen?

*Ex 5.2.9 in Pitman's Probability*
